Bringing Scrum to Development with AI

How people and AI work together

Putting Scrum into practice through its **roles and events**

Human

Sets direction and priorities.
Decides what to adopt.

Clarify the work together

Product Owner AI

Turns decisions into issues

Create / update

GitHub Issue

Start when ready

Planning

Developers → Coordinator

Human approves

Development

Build and test
Review each other's work

Review

AI PO checks acceptance

↓

Human reviews & decides

Retrospective

Proposes improvements

Human chooses changes

Hand off findings

Developers AI

Two developers, two separate solutions

AI PO uses findings to update specifications and issues

Coordinator AI

Manages the entire cycle

Who does what

Human

Stakeholder / PO

- Sets direction and priorities with the AI PO
- Makes decisions on plans, results and improvements

⇄ Discuss and clarify

PO AI

- Works through priorities and writes specifications and issues
- Checks the result against acceptance criteria

Coordinator AI

- Manages each issue and compares the two solutions
- Merges the chosen work, cleans up and runs the retrospective

Developers AI

- Plan, build and test separate solutions to the same issue
- Review each other's pull requests (PRs)

PO = Product Owner. The coordinator is the template’s “development team” role.
There is no separate Scrum Master.

Refinement: defining what to build

Human

Discusses the goal with the AI PO.
Sets direction and priorities.

Discuss & clarify ⇄

PO AI

Records decisions in the specification (spec.md) and scopes the next issue.

Write →

GitHub Issue

Serves as a Product Backlog Item (PBI). States the purpose, scope and acceptance criteria.

The PO orders the work and marks an issue ready. This starts the coordinator and planning.

Here, the human and AI PO lead refinement. Developers join at planning.
In Scrum, developers also take part in refinement.

Planning: agreeing on what and how

Each issue follows the flow of a Sprint, without a fixed Sprint timebox.

Developer AI
Claude Code

Reads the issue and drafts a separate plan.

Developer AI
Codex

Reads the issue and drafts a separate plan.

Two plans →

Coordinator AI

Presents both plans and open questions to the human.

Plans →

Human

Checks the plans against the goal.
Refines and approves.

↩ Gaps in the specification? Resolve them with the PO.

Once the human approves, both developers build and test their own planned solution.

This process does not include a Daily Scrum.

Development: two solutions, mutual review

Two developers work independently on the same issue, using the plans the human approved.

Developer AI
Claude Code

Builds and tests
the approved plan.
Opens PR 1.

Review each other's PR ⇄

Developer AI
Codex

Builds and tests
the approved plan.
Opens PR 2.

Two PRs and review findings →

Coordinator AI

Compares both
solutions and
the review findings.

The coordinator recommends a PR for the AI PO and the human to review.

Within the approved plans, AI handles implementation, testing and mutual review.
No human work is required during this stage.

Review: inspecting the result and deciding

After developer reviews, the AI PO checks acceptance. Then the human reviews the result.

Coordinator AI

Compares the two solutions and reviews. Recommends a PR.

Proposed PR →

PO AI

Checks the result against the specification and acceptance criteria. No code review here.

↩ If changes are needed, the coordinator arranges fixes and another check.

Acceptance findings →

Human

Inspects the actual result. **Decides whether to adopt, request fixes, or revise the criteria.**

↩ Revising criteria? Update the specification and issue with the PO.

After the human chooses the result, the coordinator merges it, cleans up and starts the retrospective.

Retrospective: improving how we work

Once the chosen result is merged, look back at how the issue was handled.

Coordinator AI

Uses test and review records to identify improvements backed by evidence.

Proposed changes →

Human

Considers each proposal. **Chooses which changes to adopt.**

Approved changes →

Coordinator AI

Updates procedures and documentation. Passes specification findings to the AI PO.

The AI PO and the human use the findings to refine future specifications and issues.

Check whether the changes help on the next issue.
Approving a change, applying it and checking its effect are separate steps.
